

UAV INSPECTION SERVICES

OST Services (OST) provides Unmanned Aerial Vehicle (UAV) inspection services with particular emphasis on interior and confined spaces.

These inspections, and our collision-tolerant device, are particularly useful for remote, or inaccessible locations where extensive access (scaffolding, etc.) would otherwise be required. Some items demanding periodic inspection that would benefit by using our UAV includes the following:

- Pipe supports
- Cooling towers
- Boiler internals
- Stacks interiors
- Ducts and flues
- Structural components
- Pressure vessel interiors
- Circ Water Intake/Discharge Systems

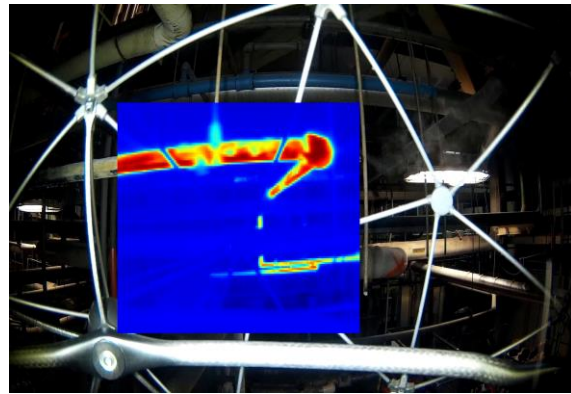

Our **Elios** UAV (the world's first collision-tolerant drone), was specifically designed for out-of-sight flying.

Equipped with a patented protective frame and super bright on-board LED lights, our UAV can work its way into areas where a person cannot reach or is unable to perform examinations in a timely and efficient manner.

With an on-board camera, the device captures footage in stunning **Full High Definition**, and its **Thermal Imaging** camera can detect issues not visible to the naked eye.

Our pilots are all licensed under FAA's Part 107 and certified to OST Services procedures and standards. We also offer conventional exterior inspections with our Phantom 4 UAV.
